EXPERIENCE

UPS

Software Engineer

Parsippany, NJ
April 2025 – Present

- Served as product engineer for several AI-augmented tools, one of which resulted in saving 4+ hours of PI Planning per dev team per sprint
- Engineered an ADO pipeline that extracted data from IBM Mainframe, uploaded to GCP and distributed to the regulatory team in the form of Ace Truck Manifest Reports, 3 times a day through a scheduled automation running on a self-hosted agent
- Created a reporting AI agent to help detect and resolve 2000+ vulnerabilities across multiple data centers used by more than 15 dev teams
- Built and enhanced a Data Generator Tool used in dev environment for shipment creation and performance testing of 540,000+ shipments
- Orchestrated cross-team software migrations (WebLogic and SQL Server) enhancing system performance by up to 30% for multiple teams
- Developed a python tool to connect and drain non-zero depth queues in multiple IBM MQ Queue Managers at 10x speeds using multithreading

Apixio

Software Engineering Intern

San Mateo, CA
June 2024 – Aug 2024

- Engineered a React web platform for viewing and testing 100,000+ patient data sets, later deployed to production using a Jenkins pipeline
- Created and maintained in-house reusable UI components, increasing horizontal feature scalability by 5 times across multiple platforms
- Formulated filtering and search capability solutions for several patient data sets, helping QA save over 2+ hours of manual work per test cycle
- Designed an NLP-driven summarization widget for lengthy patient healthcare records, potentially saving up to 75% of manual summarization time
- Built pagination and data extraction solutions across multiple datasets containing medical codes, enhancing data cleanup speeds by over 50%

New York Institute of Technology

UI/UX and Frontend Developer

New York, NY
May 2023 – June 2024

- Designed and tested 50+ courses using HTML, CSS and JavaScript, building custom modules as per professor's requirements
- Refactored 25,000+ lines of legacy code to deliver accessible and consistent UX across the university's Canvas LMS platform
- Supported cross-campus technology infrastructure for academic services by managing student data systems, inventory platforms, and reporting solutions using Microsoft Power Platform serving 5,000+ students and 400+ professors

SKILLS

Languages	Python, Java, HTML, CSS, JavaScript, TypeScript, C, C++, SQL, PL/SQL, Bash
Frameworks & Libraries	React, Redux, Node.js, Express, Tailwind CSS, Bootstrap
AI/ML & Database	Generative AI, Agentic AI, MCP, OpenAI, Anthropic, Prompt Engineering, MongoDB, PostgreSQL
DevOps & Tools	Docker, Git, CI/CD Pipelines, Jenkins, Cypress, OpenShift, GCP, JFrog, Grafana, Jira, Azure DevOps, Figma

EDUCATION

New York Institute of Technology (2022 – 2024)

Master of Science in Computer Science (With Distinction)

Gujarat Technological University (2018 – 2022)

Bachelor of Technology in Mechanical Engineering (With Distinction)

PROJECTS

ReqBridge – AI Requirements Intelligence Engine | *Python, FastAPI, LangGraph (multi-agent), MCP, SQLAlchemy/SQLite, React, TypeScript*

- An AI multi-agent system that converts messy requirement documents into structured and estimated Agile work items via a multi-stage LangGraph agent pipeline, with 95% extraction accuracy saving over 2 hours per feature per PI
- Real-time WebSocket tracking and human-in-the-loop approval gates before pushing to ADO, reducing manual backlog grooming time by 75%
- Cuts LLM cost and latency by more than 50% via a two-model strategy and asyncio parallelism
- Exposes the platform as an MCP server for natural-language AI-assistant orchestration, with full source to ADO traceability capable of processing well over 500 work items in a single session

Job Application Resume CoPilot | *Python, FastAPI, OpenAI, BeautifulSoup, React, TypeScript, Docker*

- An LLM-powered application that finds live postings across fragmented, undocumented job boards (httpx + BeautifulSoup HTML scraping) and creates a tailored resume for each posting with strict factual integrity
- A React + TypeScript frontend with drag-and-drop upload, real-time progress tracking, a sortable results grid, and in-browser PDF preview
- Runs on a reliable backend pipeline that keeps working even when external services fail – using automatic retries, request throttling, and caching
- Fail-safe AI engine, swappable across 3 providers (OpenAI, an offline mode, and a self-built local bridge) with no code changes
- A weighted ATS scoring engine that shows a measurable before and after match improvement for every tailored resume

Bird Sound Generator | *Python, TensorFlow/Keras, GANs, Librosa, NumPy, Matplotlib*

- An end-to-end Generative Adversarial Network (GAN) system built using Keras and TensorFlow that synthesizes novel bird songs from raw audio waveforms (noise), training a generator and discriminator over 50 epochs
- Uses a Librosa pipeline that loads recordings at 22 kHz, trims to fixed-length clips (5s) and normalizes waveforms to the [-1, 1] range
- Monitors training progress with performance charts, sound-wave plots and audio playback to confirm model improvements before saving

My Finance Tracker | *MERN Stack (MongoDB, Express, React, Node.js), TypeScript, REST APIs, Mongoose, Clerk (Auth), Vite*

- A full-stack personal finance tracker that uses a 4-endpoint RESTful CRUD API over user-scoped finance records
- Leverages Clerk authentication so every record is scoped to the signed-in user, eliminating custom password or session handling
- Centralizes app data in a React Context shared by the whole dashboard avoiding out-of-sync copies (displayed in a React Table grid)
- Uses one shared TypeScript definition for a finance record across client and server making the data format type-safe
